

CorasWorks Workplace Suite v10 for SharePoint

Design Better, Build Faster, Manage Easier... Accomplish More!

With the CorasWorks Workplace Suite v10, you can **accomplish more**. Lower operating costs by designing and building productivity enhancing applications. Reduce the Total Cost of Ownership of your SharePoint® environment and solutions. Bring the richness and usability of the Web to SharePoint. And empower your business units to be self-sufficient with their solutions, yet maintain overall solution control within IT.

With the Workplace Suite, developers, power users (builders), and system/site administrators can design, build, and manage applications on SharePoint without the costs and complexity of custom code development and system maintenance.

End users benefit from the drastic improvements to the overall SharePoint user experience and are able to work more efficiently and effectively, improving their productivity and increasing SharePoint adoption rates.

Design Better

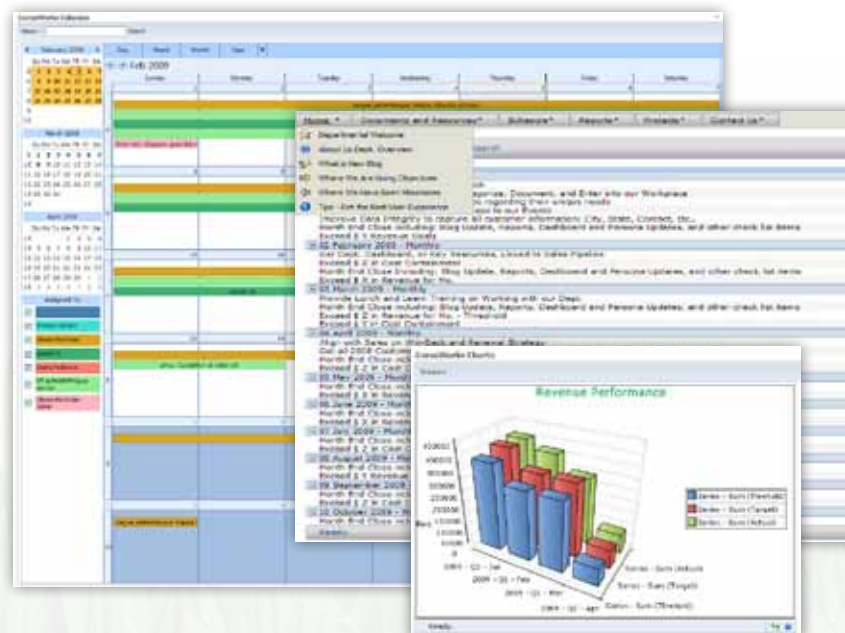

The Workplace Suite v10 includes design tools to help ensure you build high-performing, stable, and sustainable applications. These tools are the result of the experience we have gained by working with literally thousands of organizations who are deploying SharePoint. By leveraging proven designs, you're able to build solutions that are sustainable and maintainable over time.

Manage Easier

For anyone who builds or manages applications, you know the real time and effort is spent managing and maintaining those applications once they are deployed. Our One-Touch™ Management System includes a broad set of tools and capabilities that increase the manageability and maintainability of SharePoint environments and applications.

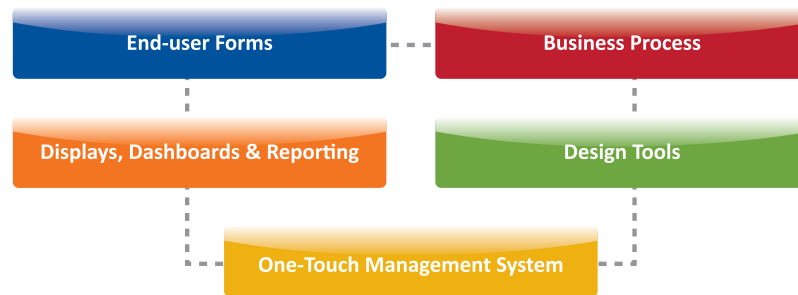

Build Faster

There are clear advantages to building faster. You can get to production more quickly, thus satisfying your end users. And you save significant time and money, satisfying everyone else in the organization. The modular, component-based architecture of the Workplace Suite enables such speed. It includes Web 2.0 technologies and wizard-driven building tools that enable you to build rich Internet applications with mouse clicks, not code.

KEY FEATURES OF THE WORKPLACE SUITE v10

Version 10 of the Workplace Suite incorporates all your favorite features from previous releases and adds many more to ensure that everyone in your organization can ***accomplish more.***

End-user Forms

The End-user Forms included with the Workplace Suite allow users to work with information in the context of the specific solution, instead of working directly in a SharePoint list or library. These runtime forms provide an intuitive, friendly way of adding and editing information. You can use our out-of-the-box forms or create your own custom forms using our Builder Wizards.

Business Process

With the Business Process features, organizations can automate and add workflow to any defined process. Our workflow capabilities include event-based triggers, scheduled activities, and email notifications. The Workplace Suite also includes elements of Human Workflow, such as end-user actions, which allow end users to interact directly with the information and push it through a process.

Displays, Dashboards, and Reporting

Our Displays, Dashboards, and Reporting feature set provides instant access to real-time data and information from across the enterprise. The rich, interactive grids, calendars, and charts connect to and aggregate data so you can build dashboards and reports against any data, including external data. You can also create your own custom displays, views, and reports using our Builder Wizards.

Design Tools

The Design Tools included as part of the Workplace Suite help ensure you optimize your environment and solutions for performance and use. AJAX-enabled templates ensure optimal performance, and our Master Page Wizard ensures consistent design, look, and feel to your sites and solutions. The navigation tools make it easy for users to move around the environment, and allow you to introduce both a structural and virtual design to your environment.

One-Touch Management System

The CorasWorks One-Touch Management System significantly reduces the time and effort required to manage and maintain your SharePoint solutions. System/site admins can make environment-wide changes to navigation, displays, data connections, end-user actions, workflow capabilities, and site portfolios, all from a single location. Components and applications can be “locked down,” giving users the ability to work with information, but not alter the underlying configurations. And, our Global Links make it easier to promote your solutions from development and testing environments into production.

The CorasWorks Community

The CorasWorks Community (<http://community.corasworks.net>) builds on the value of the Workplace Suite by providing a free public community aimed at increasing business value for those deploying CorasWorks software. Designed to encourage interaction and sharing among customers, partners, builders, developers and end-users, the CorasWorks Community features downloadable applications and building blocks, as well as other valuable resources such as white papers, design blueprints, how-to guides, forums, and blogs. The Community provides a wealth of resources that make it even faster and easier to design, build, and manage your applications on SharePoint.

ABOUT CORASWORKS

With over 1,000 customers and more than 1 million users worldwide, CorasWorks is a leading provider of modular application development software for Microsoft SharePoint. Customers use our products to build web-based solutions such as project- and process-oriented solutions and line of business applications. Our modular architecture makes it easy to design, build, and manage an integrated workplace of collaborative business applications, without the time and expense of custom development.
